Arc Guard System™

Monitor your installation, anytime and anywhere

ABB is a leader in electrical safety with the TVOC-2 Arc Guard System™ providing an unrivaled optical arc mitigation device with one of the fastest reaction time on the market. Connection to cloud based ABB Ability™ Energy and Asset Manager platform provides possibilities for remote monitoring.

Safety and protection

Saving lives and minimizing damage to equipment

With the market-leading reaction time of less than 1 millisecond, combining TVOC-2 with the E6 extension module's supervised detectors creates one of the most reliable solutions available. By adding the HMI-COM module, information regarding any trip travels faster, reaching the right people sooner.

Continuous operation

Keeping the business running

The TVOC-2 detects the light from an arc flash and, together with the installed breaker, cuts the current feeding the arc extremely quickly, minimizing disruption of the system. With detectors tested every 10 seconds, the E6 extension module keeps users updated on the installation's status. In addition, the current sensing unit CSU-2 ensures the Arc Guard System™ only trips when necessary, eliminating the risk of nuisance tripping.

Easy to install

Factory calibrated detectors

Configuration of the TVOC-2 is done in minutes and with the HMI verifying every setting done, it is extremely unlikely that mistakes will happen during the configuration. With the possibility to accommodate up to 30 detectors, the system is highly flexible and can grow with any system. The E6 extension module enables users to expand installations easily, integrating up to 20 supervised detectors.

Introduction

TVOC-2, ABB's Arc Guard System™, builds on the well known TVOC design. Its functions and features improve an already great product, putting even more focus on reliability, flexibility and simplicity.

Arc Guard System™ increases the protection of people and equipment, and minimizes unnecessary production stops. TVOC-2 is ABB's state-of-the-art solution for arc fault protection in all applications.

With over 40 years of experience, Arc Guard System™ has become an industry standard in several key markets, helping to protect personnel and businesses around the world.

Typical applications include all low- and medium-voltage switchgear where a high level of protection is needed.

Reliability

- Certified according to functional safety (SIL-2) standard
- Over 40 years experience in Arc Guard Systems™
- Pre-calibrated optical detectors
- Testing the full length of the supervised detectors, the module confirms the entire system is ready and functioning
- Factory tested current sensors with Rogowski technology for both LV and MV applications

Flexibility

- With IP54 high protection degree, HMI (Human Machine Interface) can be mounted on the panel door
- HMI-COM (HMI with communication module) adds ability to communicate with a remote station using Modbus RTU. Also the current sensing unit is able to communicate through Modbus RTU.
- Expandable with up to 30 standard detectors or 20 supervised detectors
- Configure the system to isolate separate breaker zones of the switchgear
- Add current sensing unit only if dual conditioning is needed

Simplicity

- User-friendly start-up menu
- DIN-rail or wall-mounted
- Easy to expand as the switchgear functions are added

Arc Guard TVOC-2 and TVOC-2-E6 Extension module

System description

Short-circuit faults in LV and MV switchgears are often accompanied by an electric arc. An arc fault can lead to considerable damage to equipment and injury to personnel unless it is detected very quickly. To avoid severe damage to equipment and to personnel that are in proximity of the switchgear during the arc flash, it is crucial to de-energize the system before the energy level has increased to dangerous levels. With the Arc Guard System™ the time to de-energize the system can be reduced to 30-50 ms.

The Arc Guard System™ quickly detects an arc fault and trips the incoming circuit breaker. Using light as the main activation criteria, it trips almost instantaneously. Thanks to this key functional advantage, it overrides all other protections and delays, which is crucial when reaction times need to be measured in milliseconds.

How it works

The system acts in three phases:

1 Detection

The TVOC-2 detects the light from an arc flash

2 Recognition

The system determines the intensity of light

The diagram below shows how the exponential increase in energy over time affects different switchgear materials.

Total clearing time = ABB Arc Guard System™ + breaker

3 Action

The system sends signal to trip breaker(s)

Arc monitor TVOC-2

Functionality

Arc monitor

With its modular concept, the Arc monitor is designed to fit all types and sizes of low- and medium-voltage switchgears.

It is designed according to functional safety, and is SIL 2-certified according to IEC 61508 and IEC 62061 which highlights the full focus on reliability. This corresponds to performance level d according to EN ISO 13849-1. Safety functions are exclusively handled by hardware. In addition, the system, trip logs and user-interface are all microprocessor-monitored.

The system can be configured to trip selected breakers, depending on which detector that detects the light.

The DIP-switches that take care of this function also handle settings like auto-reset and current sensing units (see pages 12-13 for more details).

Energy is stored in the unit for operation up to 0.2 s if the supply voltage fails. This is sufficient to close the tripping circuit even if voltage disappears at a short-circuit fault.

Note: The circuit breaker still needs a back-up energy source for its tripping circuit.

Connections

All connections can be accessed from the front of the Arc Guard System™. Pluggable terminal blocks allow electrical wiring before mounting TVOC-2 into the cabinet.

The solid state tripping contacts are type IGBT, which guarantees fast and reliable tripping.

More details can be found on page 12, technical data.

HMI (Human Machine Interface)

- Handles settings with key-pad and full text display
- Holds error log and trip information after power loss
- Error log and trip log include time/date stamp from a real-time clock
- TVOC-2 can handle two separate HMIs (cabinet door and on product)
- Three-meter cable included
- HMI-COM available using Modbus RTU

Extension module and detectors

Description

Extension module

The arc monitor is delivered with 10 optical inputs. With extension module, you can add up to 20 optical inputs to monitor your installation. You can choose between:

- TVOC-2-E1 extension module for standard detectors up to 30 m
- TVOC-2-E3 extension module for 60 m standard detectors
- TVOC-2-E6-S extension module for supervised detectors up to 30 m.

TVOC-2-E1 extension module

Detectors

- Fiber-optic detectors not affected by electrical noise
- Pre-calibrated detectors remove need for manual configuration
- Up to 30 standard detectors or 20 supervised detectors can be connected
- By adding the E6 extension module with supervised detectors, the users are informed immediately if detectors are cut or disconnected.

Detector

TVOC-2-E6-S Extension module for supervised detectors

Easy to install, self-calibrating and reliable

Benefits of the E6 extension module:

- 100% fiber optic cabling
- Easy-to-install point detectors. No complex loop detectors
- Self-calibrating system is quick and easy to start
No on-site calibration required
- All errors communicated through HMI or Modbus RTU communication
- Same familiar interface to main unit as the existing E1 and E3 extension modules

Current Sensing Unit CSU-2

Functionality

Current Sensing Unit (optional)

The Current Sensing Unit (CSU-2) is an accessory needed in those applications where strong light is expected on a regular basis. The CSU-2 continuously measures the current in up to 3 phases and neutral to ensure that the light is created by an arc flash.

- The CSU-2 detects if the cable to the current sensor is cut or if the connection is not done properly. The unit informs the TVOC-2 of the loss of current signal.
- Rogowski coil current sensors are used with the CSU-2
- RJ45 connection between CSU-2 and current sensors
- A green light signal on top of the CSU-2 confirms correct connection
- High accuracy measurement $\pm 3\%$ of a wide range of nominal current
- Open loop variants
- Wall or DIN-rail mounting.

HMI

- Touchscreen panel
- Communication with Modbus RTU to configure and monitor the CSU-2 remotely.

TVOC-2 connection

- CSU-2 and TVOC-2 are connected via a fiber optic cable that sends a continuous light signal if no errors or over current is present
- TVOC-2 together with CSU-2 will have a tripping time of approximately 2 ms depending on the amplitude of the over current and the number of phases measured.

CSU-2LV

Arc Guard System overview

Arc monitor

- 3 IGBT solid state tripping contacts
- 2 change-over trip signal relays
- 1 change-over self supervision alarm relay (IRF)
- 2 current sensing unit inputs
- 1 current sensing unit output

Mounting alternatives

- DIN-rail
- Wall mounting

Optical detector inputs

- 1-10 Main unit X1
- 1-10 Extension module X2
- 1-10 Extension module X3
- 1-10 Extension module E6

HMI

- Can be mounted on door
- IP54
- Additional HMI possible
- User-friendly start up menu
- HMI-COM version available

Current Sensing Unit

- 4 current sensor inputs (RJ45 connector)
- 1 change over trip signal relay for over current
- 1 optical input from other CSU
- 2 optical outputs
- Modbus RTU

Certifications and approvals

Designed according to the appropriate specifications, the devices in this catalogue have been built and tested. They can be used in most countries without any further certifications.

Some countries, however, require certification according to their own national standards. In other cases, the Marine for example, approvals ratifying that particular specifications have been met are necessary.

The table below shows the approvals and certifications for different devices.

The following documents may be obtained on request:

- Certificates of conformity
- Certificates of certification or approval.

The use of certified devices does not exonerate the equipment supplier from complying with the legal specifications of the country concerned.

Explanation of symbols:

■ **Standard design approved**, the company labels bear the certification mark when this is required.

	Certifications								Approvals: ship classification societies

Applications

Basic installation tips

Arc monitor (TVOC-2)

The Arc monitor can be mounted anywhere in the switchgear, e.g. in the breaker cubicle or in a separate control or metering cabinet. Tripping is handled by a separate tripping circuit. The task of the Arc monitor is to, in combination with the breaker, disconnect the circuit very quickly. You can connect up to 3 breakers in this way and, if required, trip different breakers depending on where the arc occurs.

Current sensing unit (CSU-2)

The CSU-2 is an accessory used if you cannot prevent direct sunlight or other highly intensive light reaching the sensors. CSUs can be mounted in series if more than two are needed. The CSU-2 is connected to the main unit with fiber optic cables. The unit sends a continuous light to the main unit until either an error or over current turns off the signal.

Connection of current sensors (for CSU-2)

The CSU-2 measures 1 to 3 phases and neutral if needed. Current sensors for LV is offered together with the CSU-2LV and sensors for CSU-2MV are sold separately (see below link). The current sensors are connected to the CSU-2 with RJ45 connectors. A green LED light indicates correct connection. Red LED light indicates if the connection is not done properly according to settings in device.

<https://new.abb.com/medium-voltage/apparatus/instrument-transformers-and-sensors-id/products/sensors-new>

Current measurement is based on precise input from calibrated current sensors. Only dedicated current sensors RC120 and RC200 for CSU-2LV and KECA and KEVCD type for CSU-2MV can be used.

Detectors

Detector cables are available in standard lengths (see ordering details). They cannot be cut or joined. Avoid sharp bends or pinching when installing the cables.

The plastic fiber is made of polymethylene acrylate (PMMA) with a polyethylene jacket. Each detector consists of an optical cable and a lens that are calibrated together to give the same sensitivity independent of cable length. The detector has a plug-in connector that fits the Arc monitor. The lens collects light from all directions, with the exception of a small shaded area behind the detector (see the polar diagram). Practical experiments have shown that arc light reflected between metallic surfaces is normally sufficient to cause tripping.

With the supervised detectors the full length of the detectors is tested and the extension module confirms the entire system is ready and functioning.

Detector positioning

The basic strategy for positioning the detectors is to make sure to cover all parts that may suffer from an arc. Typically this involves the horizontal and vertical bus bar system and the breaker cubicle. If possible, it's also normally preferable to supervise each cubicle. Avoid placing the detector so that it sees the normal light from a breaker. The detectors can detect arcs within a 3-meter distance (see illustration). To raise the safety level even higher, you can separate them at a 1.5-meter distance, thereby creating redundancy between them.

Example 2:

Arc Guard System and Current Sensing Unit CSU-2 installed to trip breakers depending on where the arc occur.

Configuration

Trip condition configuration – Manual/auto reset configuration

System configuration using DIP switch

DIP switches are used to configure the system regarding use of current condition (activated CSU inputs) and assigning detectors to breaker trip outputs (so-called selectivity). They are located on the front (low, left) of the Arc monitor.

DIP switches

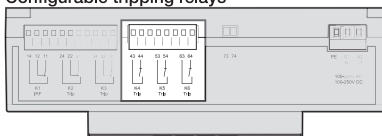

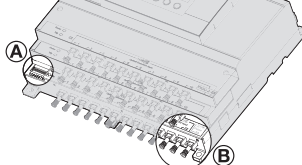

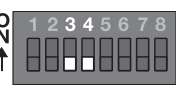

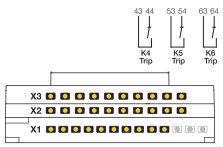

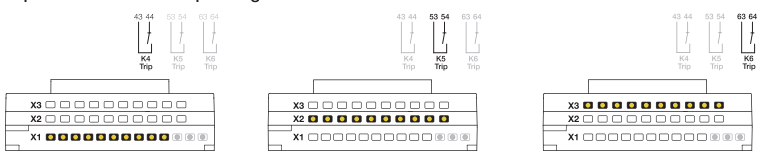

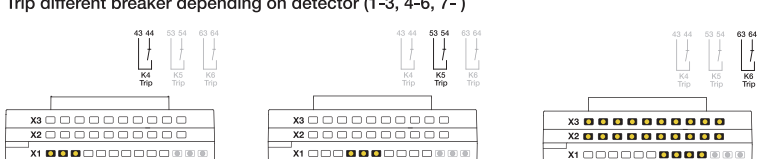

Sw1	Current condition inputs Terminals X1:21-22	Sw5	Not used

Output relay K4	Terminals X1:1-10
Output relay K5	Terminals X2:1-10
Output relay K6	Terminals X3:1-10

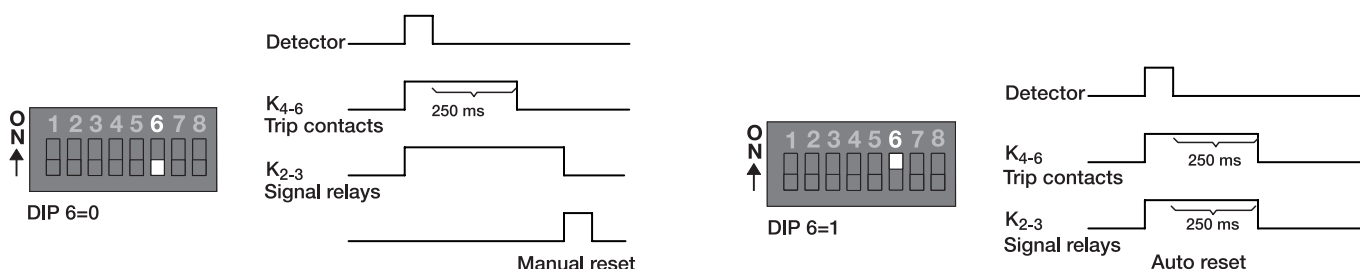

Trip condition configuration

TVOC-2 can be configured to trip selected breakers depending on which detector is signalling for an arc. This can be used to trip sections of a switchgear or use one monitor for several small switchgears. It also has an option to add a current condition, see page 13.

Manual/auto reset configuration

The signal relays K2, K3 can be configured to react as the trip contacts (auto reset) or to be de-energized by manual reset on the HMI. See below for explanation.

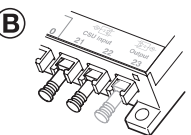

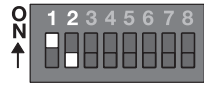

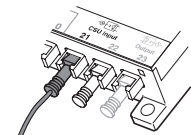

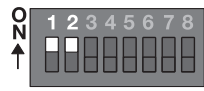

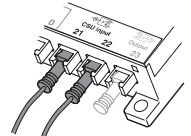

Configuration

Current condition configuration

Normal trip configuration with additional current condition

A current condition is an option that could be used to avoid the risk of nuisance tripping due to strong light from other sources than arcs. The main risks are light from arc chutes and direct sunlight, which in normal cases can be avoided.

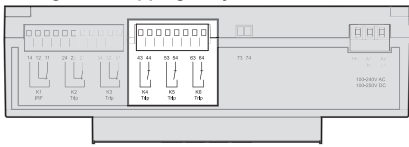

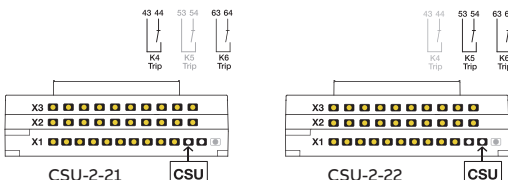

All trip configurations on page 12 can be combined with an additional current condition. It is possible to connect up to two current sensing units directly to the arc monitor (AM) (input 21 and 22). To connect additional current sensing units in series is also possible if required. To share the current condition between different arc monitors can be done by connecting output 23 on the first arc monitor to the standard current sensing units input on the other. The arc monitor will then block the trip condition until it detects an over current.

No current sensing unit		Sw1	Sw2	Function current condition
A 	B 	0	0	Not used
One current sensing unit 		1	0	Input CSU21 used
Two current sensing units 		1	1	Both inputs used

Special trip configuration depending on over current

The arc monitor has a special trip configuration that determines trips depending on where it detects the over current. This configuration will then trip different breakers depending on which supply is showing an over current.
